

Setup Guide

Everything you need to get Clientflow running and keep your client & project data safe — no login, no subscription, no cloud required.

Offline-first

Single HTML file

Your data, your device

Works in any modern browser

SECTION 01

What Clientflow is — and isn't

Clientflow is a single HTML file that runs entirely in your browser. There's no install, no account, and no server. Everything — every client, project, task and invoice — lives in a data file on your own device, under your control.

What it does

- ✓ Tracks every client and project in one dashboard
- ✓ Kanban board for project status, with tasks & due dates
- ✓ Invoice tracking with revenue charts, built in
- ✓ Works completely offline, forever

What it isn't

- ✓ Not a Gantt chart / enterprise PM tool
- ✓ Not a team tool — single user, single device at a time
- ✓ Doesn't generate PDF invoices to send to clients
- ✓ Doesn't convert currencies automatically

SECTION 02

Opening the app for the first time

Double-click **KiTeeStudio-Clientflow.html** to open it in your default browser, or drag it into an already-open browser window. On first launch, Clientflow will ask how you'd like your data stored.

1 Create a new data file (recommended — Chrome, Edge, or Brave)

Choose "Create a new data file" and save it somewhere memorable, like your Documents folder or a synced folder (Dropbox, iCloud, OneDrive). Clientflow will call it **Clientflow-Data.json** by default — keep that name so future backups are easy to identify. From now on, every change you make is written straight to this file automatically.

2 Open an existing data file

If you've used Clientflow before and have a **Clientflow-Data.json** file already, choose this option and select it. All your clients, projects and invoices will load immediately.

3 Continue in browser storage (Safari, Firefox, or mobile)

Not every browser supports linking a file directly. If you don't see the file options, or you'd simply rather not link a file, choose this option — your data is saved securely inside the browser itself. Use the **Export all data (JSON)** button in Settings regularly to keep a backup copy.

Which browsers support linked files?

Google Chrome, Microsoft Edge, and Brave (desktop) support the File System Access API used for direct file linking. Safari and Firefox — and all mobile browsers — automatically fall back to secure in-browser storage. Either way, your data never leaves your device.

SECTION 03

How saving works

Clientflow saves automatically. There's nothing to remember — but it helps to understand what's happening under the hood.

STORAGE MODE	WHERE YOUR DATA LIVES	HOW IT SAVES
Linked file	The Clientflow-Data.json file you chose on your device	Written automatically on every change. A brief "Saved" flash appears in the header. Use the Save File button any time to force an immediate write.
Browser storage	Your browser's local database (IndexedDB), tied to this browser on this device	Saved automatically on every change. The Save File button downloads a fresh backup copy as a JSON file.

Browser storage is tied to one browser, on one device.

Clearing your browser's site data, switching browsers, or moving to a new computer will not carry your data with you automatically in this mode. Export a backup from

Settings → Export all data (JSON)

regularly, and import it again wherever you need it.

SECTION 04

Reconnecting a linked file

For security, browsers ask you to reconfirm access to a linked file after closing and reopening — this is normal and only takes one click.

1 Look for the amber banner

If you see "Your linked data file needs to be reconnected" at the top of the app, your file is still linked — the browser just needs permission again.

2 Click "Reconnect File"

Confirm the permission prompt if your browser shows one. Your data loads right back in, exactly where you left it.

SECTION 05

Moving Clientflow to a new device

- ✓ Copy both **KiTeeStudio-Clientflow.html** and your **Clientflow-Data.json** file to the new device (a USB drive or cloud-synced folder both work well)
- ✓ Open the HTML file on the new device
- ✓ Choose *"Open an existing data file"* and select your copied Clientflow-Data.json

KEEPING YOUR DATA SAFE

- ✓ If you were using browser storage instead, use **Export all data (JSON)** on the old device first, then **Import from backup** on the new one

USING CLIENTFLOW

SECTION 06

A quick tour of the six tabs

TAB	WHAT IT'S FOR
Dashboard	Your daily starting point. Active projects, tasks due this week, revenue this month, and anything overdue — all in one glance, with charts that update live.
Projects	A kanban board (Prospect → Active → Paused → Complete) or a sortable list. Drag a card between columns to update its status. Click any card to open its full detail, tasks, and linked invoices.
Clients	Every client relationship at a glance — total billed, outstanding balance, and a colour-coded revenue health bar. Click a row to see their projects, invoices and open tasks.
Invoices	A 6-month revenue trend, outstanding & overdue totals, and one-click "Mark as Paid." Export everything to CSV for your accountant or spreadsheet of choice.
Focus Room	Body doubling, built in. Sit down with a simulated desk partner and work in timed rounds. See Section 09.
Settings	Business name, default currency, financial year start, active currencies, Focus Room preferences, backups, and — if you ever need a clean slate — Clear all data.

SECTION 07

Currencies — how they work

Clientflow supports GBP, USD, EUR, AUD and CAD out of the box. There's no live exchange-rate lookup — amounts are stored and displayed exactly as you enter them, in whichever currency you assign to each client, project or invoice.

Why no conversion?

Exchange rates drift daily and require an internet connection to fetch reliably — which conflicts with Clientflow's offline-first design. Dashboard totals are calculated in your chosen *default currency* (set in Settings), using only invoices issued in that currency.

SECTION 08

Clearing your data

Settings → Danger Zone → Clear all data permanently erases every client, project, task and invoice on this device. You'll need to type **DELETE** to confirm — this cannot be undone, so export a backup first if there's any chance you'll want it again.

SECTION 09

Body doubling, built in

Body doubling is the trick of working alongside someone else so that starting feels easier and drifting off feels harder. Clientflow has one built in — no video call, no scheduling, no other humans. Your desk partner is generated on your own device: the ambient sound is synthesised live in the browser and the visuals are drawn frame by frame, so there are no audio files, no streaming and nothing to load.

1 Pick what you're working on

Open the **Focus Room** tab. Your most urgent open task is already selected, so you can just press start — or choose a different task, or type a one-off intention. You can also start a session straight from any task: press the small ► button next to it on the dashboard or inside a project.

2 Choose your sound and your scene

Five ambiances (rain on glass, café corner, brown noise, studio hum, or silence) and four moving visuals (a paced breathing orb, a drifting particle field, a pulse that reacts to the sound, and a near-still minimal wash). The **typing partner** toggle adds keyboard sounds with a realistic burst-and-pause rhythm, plus a partner visibly working at their desk. Everything can be changed mid-session.

3 Work in rounds

The countdown runs a focus round, chimes, drops into a break, then chimes back in for the next round. Press **space** or the pause button to stop the clock, **+5 min** to stretch a round, and tick tasks off without leaving the room.

4 Minimise and keep going

Minimise (or press Escape) tucks the room away and leaves a small pill in the corner — your partner keeps working and the clock keeps running while you use the rest of Clientflow. Click the pill to step back in.

Everything is logged.

Finished rounds are recorded against the task and project you chose, so the Focus Room shows minutes focused today, sessions today, your current streak and your all-time hours, plus a 14-day chart. If a session is interrupted — you close the tab, your laptop sleeps — Clientflow offers it back next time you open the app, with the time already banked.

If motion or sound is a problem.

Set your ambiance to *Silence*, turn the typing partner off, or pick the *Minimal* scene. Clientflow also honours your system "reduce motion" setting automatically: animation is dialled back and the partner is drawn still. Sound only ever starts when you press start — nothing plays on load.

Partner name, default round length, break length and the chimes can all be changed under **Settings** → **Focus Room**.

SECTION 10

Troubleshooting & FAQ

? The "Save File" button says there's an error

Your browser may have revoked write permission to the linked file (this can happen if the file was moved, renamed, or deleted). Go to Settings and use **Link new file** to relink it, or open your most recent backup.

? I don't see "Link new file" options at all

Your browser doesn't support the File System Access API. This is expected in Safari, Firefox, and all mobile browsers — Clientflow automatically uses secure browser storage instead. Export a JSON backup periodically from Settings.

? Can I use Clientflow on two devices at once?

Clientflow is a single-user, single-device tool by design — there's no sync or server. Keep one device as your "source of truth," and use Export/Import to periodically transfer a snapshot to another device.

? An invoice shows "Overdue" even though I haven't sent it

Clientflow automatically marks any invoice as Overdue once its due date has passed, unless it's already marked Paid. If you're not ready to chase payment on a Draft invoice yet, simply update its due date.

? Where is my data physically stored?

Either in the Clientflow-Data.json file you linked (readable in any text editor), or inside your browser's local IndexedDB storage, scoped privately to this page. Nothing is ever sent over the network.

? I can't hear anything in the Focus Room

Check the volume slider and the  button in the room's sound panel, and make sure the ambience isn't set to *Silence*. Browsers only allow sound after you interact with the page, which is why nothing plays until you press start — if you started a session from a restored tab, press pause then resume to wake the audio.

SECTION 11

A note on browser support

Clientflow is tested on current versions of Chrome, Edge, Brave, Firefox and Safari, on both desktop and mobile. For the smoothest experience — including direct file linking — a recent version of Chrome or Edge on desktop is recommended. The Focus Room's sound uses the Web Audio API, supported by every current browser.

That's it — you're set up.

Open KiTeeStudio-Clientflow.html any time to pick up exactly where you left off. No login, no loading spinner, no subscription reminder. Just your business, at a glance.
